Upgrade from Caché 2013.1.7 (Build 974U) to 2017.2.2 (Build 865USU): Any experience/known issues/checklists/hints?

Upgrade of custom application

Dear community,

we are a company located in central Germany working with Intersystems Caché since 2003 (Jesus, that's actually a long time in IT).

As we struggle to keep pace with outside development we still operate on Caché 2013.1 😮

We are, of course, aware that we need to upgrade Caché and therefor plan an upgrade to 2017.2.

Now my question to you bold ObjectScript warriors:

- Did anyone do this with a legacy application (still have macro routines, the old style)?
- Has anyone experienced any bigger issues with a move like this?
- Are there existing checklists apart from https://docs.intersystems.com/cache20172/csp/docbook/DocBook.UI.Page.cls... ?
- Is there even a freelancer out there willing to help identify migration issues?

Our application is a medium sized ERPish application with around 250k lines of code. So a bit code to review.

Many thanks for your input in advance and best regards,

Udo
