## Is there a way to make an http adapter wait a certain number of seconds?

I have an http adapter that calls out to a web service and is looking for a "Completed" response. I want the adapter to wait a certain number of seconds before calling out again to get a response. I have tried setting the retry interval on the business operation but that does not do it. See my code below.

```
While pResponse.StringValue = "Processing" {  
  set tSC=..Adapter.PostURL(tURL,.tHTTPResponse,,tld)  
  do tHTTPResponse.Data.Rewind()  
  set pResponse.StringValue = tHTTPResponse.Data.Read(3000000,.tSC)  
  $$$TRACE("Second Response: " _ pResponse.StringValue)
```

```
}
```
