Impact of OREF support

There are some classes in our code base that contain *Method*s only (no properties). I told my colleagues that converting them into the *ClassMethod*s should improve performance as it would eliminate unnecessary OREF support at run-time. Some of them replied that it would be microseconds, so what is the reason to bother.

Is it possible to estimate the impact of OREF support of method calls at run-time? E.g., as a % of all CPU load.
