Kill object Vs %Reload()

```
Method1(){
```

```
Set OID1=##class(Table).%OpenId(100)
```

```
// do Kill OID
```

```
}
```

```
&SQL(Update Table Set Column=88)
```

```
Method2(){
```

```
Set OID2=##class(Table).%OpenId(100)
```

```
// Or do %Reload()
```

```
Set OID.Column=99
```

```
Do OID.%Save()
```

```
}
```

```
// Column 1 still holds value as 1
```

For getting the updated value I should do Kill OID in Method1
