## Unable to access the connection in the server explorer

I have previously setup an Atelier project and it was running. I recently received the 1.3 release. Now, I am unable to click on the previously established connection to my Cache server (as seen in the Serve Explorer. I see the connection and the little arrow (implying that there is a hierarchy of items underneath). But, clicking that arrow opens nothing. Ultimately, I was trying to access files on the server so that I could add some new ones to my existing Atelier Project.
