Purging Feeds seperately on Ensemble

I'm currently working on a project to run our medical device integration through ensemble.

I've noticed a potential problem with the volume of messages . The feed generates around 474K messages daily(average of 1 message per minute per device from 300+ devices).

We currently keep all our other feeds message data for 90 days and purge automatically. From what I can see is that the purge functions in Ensemble are production wide and cannot set it at the Business Operation, Service or Router level.

Ideally we would like to have the new feed in the same namespace & production as our other feeds. With the current purge settings of 90 days, we would need to greatly increase our server specs to cope with the extra data.

We could create a new namespace with its own production and keep a small number of days of data, but would prefer not to do this, so we can keep the number of dashboards (productions) to a minimum.

I wonder if there is a way to separately set purging on each Business service, router and Operation?

Any thoughts would be appreciated.

Kind Regards

Stuart
