Json with field exceeding maximum string length

Hi all,

I have an incoming JSON message with a string field exceeding in length the 'caché long-string limit' of 3641144 characters.

Using `{%FromJSON(instream)}` I am able to create `%DynamicObject` properly. However, I am unable to access the long property, as in every assignment, I get the `<MAXSTRING>` error.

Is there any way for me to obtain contents of the 'too long' string field as a stream?

Thanks

Jiri
