Domains to whitelist to allow Atelier updates?

Hi,

I've been going through the instructions at https://download.intersystems.com/download/atelier.csp

Our development team are on the main hospital infrastructure so we need to whitelist any plugin repositories that Eclipse will need to get updates from.

I believe I need to whitelist the sites that host the both the Atelier and Eclipse plugin repositories:

1. Atelier repositories: stable and beta are currently hosted at https://atelier.artifactoryonline.com/ but that site has 'Deprecation of artifactoryonline.com domain' notice.

Deprecation of artifactoryonline.com domain

By June 30, 2017, JFrog Artifactory Cloud will use a new domain: *jfrog.io*, and the *artifactoryonline.com* domain will be deprecated. To continue accessing your server, you need to update the URL accordingly. For example if your server name is X and you used to access your server through *X.artifactoryonline.com*, then after the change, the entry point to your server will be *X.jfrog.io*.

Any attempts to access the old domain will be automatically redirected to www.jfrog.com. All builds that point to this domain will fail since the artifacts will not be found and the response returned to the build server will be an HTML page instead of the JSON object that the build info library expects.

2. Eclipse repositories: Which domains do I need to whitelist? is download.eclipse.org sufficient for Atelier or should it be broader: *.eclipse.org

3. Are there any other domains I should whitelist - e.g. are there specific plugins that are useful for Ensemble/HealthShare development. (FHIR/REST)

P.S. I'm thinking I might need to whitelist marketplace.eclipse.org so I can use REST and other plugins not included in Eclipse PHoton JavaScript & Web developer
