## How do You Convert 8-bit Database to Unicode?

Hi Community!

Suppose you have a working system on 8-bit Caché database and need to transfer the solution to Unicode database.

How do you manage that?

There is the community solution [UConv](#) but it [doesn't cover all the cases](#).

For some cases, XML export of all globals on 8bit

```
d $system.OBJ.Export("x.gbl","c:\Temp\x.xml")
```

and import on Unicode can help, which doesn't solve $LB cases though.

What works for you?
