Read command to get a line longer than 32767 symbols

I'm using this code to read a file, line by line.

Most lines are shorter than 32767 symbols, but some are longer. No line is longer than \$\$\$MaxStringLength and long strings are enabled.

Is there a param to Open/Read command I can pass to increase Read limit?

My code:

```
set filename = pFile
open filename:("R")
for {
    use filename read x
    quit:$ZEOF=-1
    set ^dbg($i(^dbg)) = $lb($e(x,1,10), $e(x,*-10,*), $l(x))
}
close filename
```

I've checked [reclen parameter](#) but it did not seem to help
