Issues on Mixed Mirrors of IRIS vs. Caché

I'd like to make you aware of a trap I just fell into.

I run a Mirror for Caché some while using an Arbiter - OK

Now some months later I installed IRIS and planned a Mirror with ISCAgent.

That broke my ISCAgent for Caché.
And in addition to my Caché modules my analysis showed me:

On Windows, ISCAgent is installed into **C:\Program Files (x86)\Common Files\InterSystems\Agent**

And in added to my Caché modules, I see a bunch of iris*.dll and CacheCOM64.dll nicely side by side
with IRISCOM64.dll.
BUT: only 1 ISCAgent.exe with a fresh date that isn't interested in Caché at all. Replaced by the install.

Once identified after some research this was fixed rather fast by a correct version.
and working it after I found this important note in [Locating the Arbiter to Optimize Mirror Availability](#) which applies
also to IRIS

> **Note:**
> As noted in Installing the Arbiter, any system with a running ISCAgent of version 2015.1 or
> later can be configured as arbiter, including one that hosts one or more instance of Caché.
> However, a system hosting one or more failover or DR async members of a mirror should not
> be configured as arbiter for that mirror.

Be aware of that trap.
