Python bindings

Found a strange documentation block about Python bindings in Chapter 3.6 of the Caché manipulation functions with [time and date](#). It looks like this text accidentally copied one to one of the [Perl binging documentation](#). It's funny that the packages of functions called PTIME_STRUCTPtr , PDATE_STRUCTPtr and PTIMESTAMP_STRUCTPtr is suspicious for Python :)

On the other hand, nothing is said about the functions parse_time , parse_date , parse_timestamp , which are present in /dev/python/intersys/pythonbind.py ahhh!

Has anyone encountered this problem?
