Can't uninstall without Instance Name

I loaded 2017.2 onto a windows desktop that I was going to use for testing. I need to now uninstall 2017.2 but when I do I get a ERROR saying it can not find the INSTANCE name, when there is HEALTHSHARE defined.

Has anyone else had this issue? I would like to uninstall this version and start over from scratch without having to re-image my machine.

Thanks

Scott
