How can I get the real IP Address

My database service is on the cloud server, and I access it on the company intranet. When I user the %requestCgiEnvs to get "REMOTE_ADDR ", but what I have been getting is the company's external address. I can't get my IP address in the LAN.
For example, my computer IP address is 192.168.11.11, and my company's external public network address is 214.17.17. I can only get 214.17.17 by using %requestCgiEnvs("REMOTE_ADDR"), but not 192.168.11.11.

I only want to get 192.168.11.11.

Any help would be appreciated. Thanks!
