DeepSee passing Filters in Dashboard URL

Hi

-- We have our Pivot ready for some data for all accounts. And we want to now filter it by Account

[Account].[H1].Account.&[1]

It works fine at the pivot level and it filters the records. We save the pivot with no filter values as we want users to decide the Account they want to filter for

-Now If i save this pivot without a value of a filter , then obviously it has all records and I want to filter it at the Dashboard level on my page.

URL I am passing

.....dashboard&SETTINGS=FILTER:[Account].[H1].[Account].&[1]&NOTITLE=1

The filter doesn't work If I pass it this way. However dashboard is working fine and its showing records of all Accounts. Just the filter part isn't working. So its definitely a very small issue where I am not passing the filter in the URL how deepsee likes.
