## How to run server-side methods from Angular or PHP

Hi Community,

Now InterSystems has developers definitely cut-off from Zen/CSP I am looking for sample code how to invoke server-side methods from Angular and PHP, Java client.

I only see some rest/json crud examples, but that is not the whole picture I assume.

Let's say I have a persistent Class with a class method to import or modify data...

I want to invoke this from my Angular App or PHP app.

any examples, suggestions?
