Enabling SOAP Client and Server

I'm trying to test SOAP integration by using one Ensemble production to send a SOAP message to another production, but I'm seeing the following error when I try to pass a message between the two:

ERROR #6248: SOAP response is a SOAP fault: faultcode=Server

faultstring=Internal Server Error

faultactor=

detail=

```
<error xmlns="http://tempuri.org">
```

```
<text>ERROR #7900: Service 'SOAP' not enabled for application '/csp/healthshare/hspc/'</text>
```

```
</error>
```

I'm following [this guide](#) to creating a service, and I've done the following steps which I expected to enable SOAP:

- Set ^SYS("Security","CSP","AllowClass","/csp/healthshare/hspc","%SOAP.WebServiceInfo")=1
- Set ^SYS("Security","CSP","AllowClass","/csp/healthshare/hspc","%SOAP.WebServiceInvoke")=1

The actual root of the error is proving tricky to find - does anybody know (or have a guess about) what I should do to fix this?

[#CSP](#) [#SOAP](#) [#Ensemble](#)
