Get default CSP-App Name for a Namespace

Hi,

I am looking for an API to retrieve one namespace's default web application name. We have used some code to set up links to event log/message trace for monitoring emails. In particular we did this with ensemble where the default csp webapplication name always is something like csp/<namespace/. Anyway when it comes to a healthshare installation the default path seems to be csp/healthshare/<namespace>.

To have an easy solution working for an ensemble and healthshare environment I rather like to use an API instead of evaluating the kind of installation and then hardcoding the links to use. Is there something around to use?

kind regards,

Sebastian
