## .Net Core with IRIS as DB

Hi guys,

I'm starting few POCs to test InterSystems IRIS with a .Net core backend of an API Gateway and I have few questions about this integration.

- Which .Net library is the oficial?
  - I found at least 3 options: packages from nuget website (<https://www.nuget.org/profiles/InterSystemsCorporation> - that I couldn't do them work), packages " IRISProviderCore.1.0.0.nupkg " and " IRISXEPCore.1.0.0.nupkg " inside " IRIS/dev/dotnet/bin/CorePackages " (Iris installation folder) and libs " InterSystems.Data.IRISClient.dll " and " InterSystems.Data.XEP.dll " at github sample project (<https://github.com/intersystems/stock-trading-with-dotnet-isc1134>).
- How can we check for updates to these libraries (if nuget isn't the official source)?
- Do you have any performance benchmark results (maybe comparing Native COS, Java and .Net performance)?
