Jr Developer attempting to connect to Service with Java and export to Java with Operation

I am under the impression that inside HealthShare you can Services, Processes, and Operations. The service takes incoming data, the processes can process that data, and then the operations can send that data out.

I am curious if anyone has any experience, guides, or advice on how I can send data to a service using a Java application. I intend for the data to be in XML format. I am also curious if I succeed at picking up the data in the service, how I send the data back to the Java application using an Operation.

As of now I am attempting to get this to work on a local environment.

Any input is appreciated,

Thank you,

Jess Farmer
