Create user Role to access only certain namespace in ensemble

Hi,

I am trying to create a user role which shall allow users the access to only one specific namespace in an Ensemble system. I've started creating the namespace with a database (with own resource and no public access). In the second step I've created a role by copying it from the predefined role %Developer and assigned the resource of the created database. After that I've created a user and assign him to the created role.

When trying to login to ensemble - the management portal comes up but the Ensemble tab is showed deactivated. Looking in the audit protocol I am getting the typical PROTECT notifications telling that user is not permitted to access a protected global in the cachelib database.

I am wondering what would be the correct approach to create such a role if I want to allow users of this role only be able to access a certain namespace/database without having the concern that they may access other namespaces/databases. I've already read the docs on that but somehow I seem to miss something.

Has anyone a suggestion for my issue?

Kind regards,

Sebastian
