Is there any built-in error handling features available in Zen report

Greetings,

Is there any default exception handling feature available in Zen report? I am working on a report that comprises of several different composites report (%ZEN.Report.Display.composite). I am incorporating several composites into the main Zen report. If any composite fails or encounters an issue such as issue with the sql statement or class method which i am using to fetch the data, the report (pdf) fails and shows a Zen error. It is very hard to find an exact composite or code that causes the error as Zen report displaying a generic Zen Error without any details.

So, I am adding try-catch block in the class method for each composite and recording errors in the log file (persistence class for storing errors) but I would like to know if there is any better exception handling feature available in Zen reports.

Any thoughts or solution would be really appreciated.
