IRIS/Ensemble as an ETL

IRIS and Ensemble are designed to act as an ESB/EAI. This mean they are build to process lots of small messages.

But some times, in real life we have to use them as ETL. The down side is not that they can't do so, but it can take a long time to process millions of row at once.

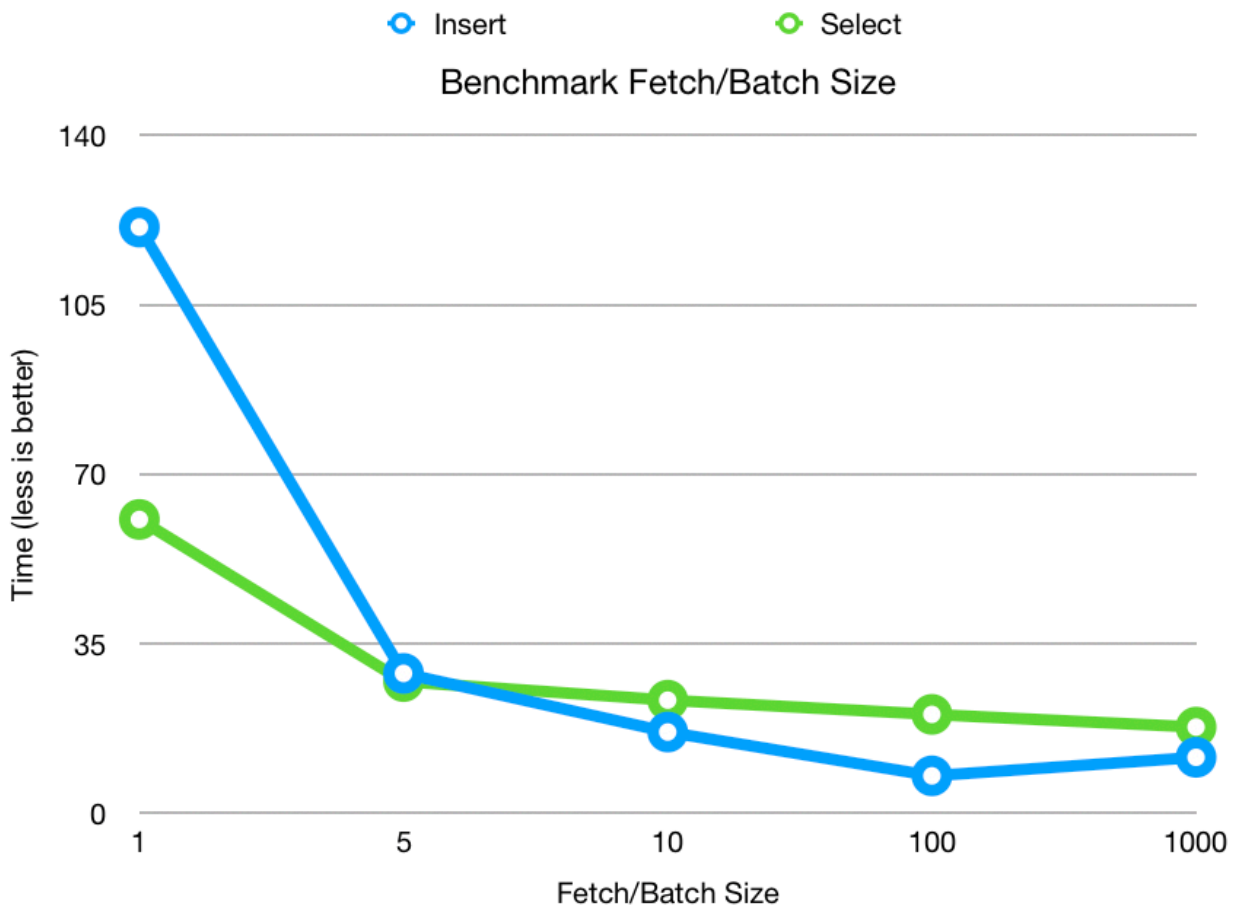

To improve performance, I have created a new SQLOutboundAdaptor who only works with JDBC.

BatchSqlOutboundAdapter

Extend EnsLib.SQL.OutboundAdapter to add batch **batch** and **fetch** support on JDBC connection.

Benchmark

Benchmarks released on Postgres 11.2 with 1 000 000 rows fetched and 100 000 rows inserted on 2 columns.

Prerequisites

Can be used on IRIS or Ensemble 2017.2+.

Installing

Clone this repository

```
git clone https://github.com/grongierisc/BatchSqlOutboundAdapter.git
```

Use Grongier.SQL.SqlOutboundAdapter adaptor.

New methods from the adaptor

- Method **ExecuteQueryBatchParamArray**(ByRef pRS As Grongier.SQL.GatewayResultSet, pQueryString As %String, pBatchSize As %Integer, ByRef pParms) As %Status
 - *pRS* is the ResultSet can be use as any EnsLib.SQL.GatewayResultSet
 - *pQueryString* is the SQL query you like to execute
 - *pBatchSize* is the fetch size JDBC parameter
- Method **ExecuteUpdateBatchParamArray**(Output pNumRowsAffected As %Integer, pUpdateStatement As %String, pParms...) As %Status

- *pNumRowsAffected* is the number of row inserted
- *pUpdateStatement* is the update/insert SQL statement
- *pParms* is Caché Multidimensional Array
 - *pParms* indicate the number of row in batch
 - *pParms(integer)* indicate the number of parameters in the row
 - *pParms(integer,integerParam)* indicate the value of the parameter whose position is *integerParam*.
 - *pParms(integer,integerParam,"SqlType")* indicate the *SqlType* of the parameter whose position is *integerParam*, by default it will be `$$$SqlVarchar`

Example

- **Grongier.Example.SqlSelectOperation** show an example of `ExecuteQueryBatchParamArray`
- **Grongier.Example.SqlSelectOperation** show an example of `ExecuteUpdateBatchParamArray`

Content of this project

This adaptor include :

- Grongier.SQL.Common
 - No modification, simple extend of `EnsLib.SQL.Common`
- Grongier.SQL.CommonJ
 - No modification, simple extend of `EnsLib.SQL.CommonJ`
- Grongier.SQL.GatewayResultSet
 - Extension of `EnsLib.SQL.GatewayResultSet` to gain the ability to use fetch size.
- Grongier.SQL.JDBCGateway
 - Use to allow compilation and support on Ensemble 2017.1 and lower
- Grongier.SQL.OutboundAdapter
 - The new adaptor with :
 - `ExecuteQueryBatchParamArray` allow SQL query a distant database and specify the JDBC `fetchSize`
 - `ExecuteUpdateBatchParamArray` allow insertion in a distant database with JDBC `addBatch` and `executeBatch`
- Grongier.SQL.Snapshot
 - Extend of `EnsLib.SQL.Snapshot` to handle `Grongier.SQL.GatewayResultSet` and the fetch size property
