HL7 HTTP - Change Content-Type

Hi,

I would like to use `EnsLib.HL7.Operation.HTTPOperation` for sending HL7 messages via HTTP. It sends the Content-Type as "text/html"

I would like to change it to something else, say "text/plain". I cannot see a way to do it.

I have now written a custom Operation (based on `EnsLib.HTTP.OutboundAdapter`) and modifying the Content-Type while POSTing using `SendFormDataArray()`. It's bit frustrating to parse the response etc.,

I would rather prefer to use `HTTPOperation` of HL7. Can somebody help?

Thanks.
