## Atelier custom \$variable support

On a system I have been working there are some custom special variables like

```
do $example.DoSomething()
```

Some code requires a

```
set x=$example.SomeProperty
```

call e.g.

My problem is that atelier doesn't seem to be able to properly recognize this code.

If i have to use a call like this it breaks the entire code completion / code checking of the file.

Does somebody know a way to index these variables in atelier or manually add them so I can work with syntax checking and code completion?

With kind regards

Martin Weber
