## Linked Tables and Dialects

Hi! I've been fiddling with linked tables to get data from other servers, and I encountered a problem that I'm curious about. Maybe I'm not using these tools as intended or there's more going on, so I'm asking here.

I'm running a query on linked table A, something simple like this:

```
select name from A where id = 5983658923646
```

And I get this error:

```
[SQLCODE: <-400>:<Fatal error occurred>]
```

```
[%msg: <>]
```

If id, or anything comparison, is something smaller like 4345, it works just fine. It's only when the where reaches a certain length, not just id, that it fails.

After switching Dialects from CACHE to MSSQL, it works! Does anyone know the reason for this? Is the linked table connection using something the cache dialect doesn't understand?

Thank you! 😊
