Zen Page Table From another namespace

Hello,

Need some technique to solve an issue about zen page table.

- "xyz" table exists in all my namespaces.

I have a simple Zen page in "USER 1" namespace. It has a tablepane which pulls data from "xyz" table.

OnLoad of the page i want the zenpage to pull the data from "USER 2" namespace with same "xyz" table name.

Zenpage has to be in "USER 1" namespace

I tried to use the server side callback handler [%OnAfterCreatePage\(\)](#) and do a ZNSPACE "USER 2" but still it is not doing the job of pulling data from another namespace.

Any suggestions will be appreciated.

Thanks,

Jimmy Christian.
