## Open a text file in Windows - Append to existing log file

Hello,

I try to open an existing log file and append to it. In Windows I use `Open file:(NRW):1`. I would expect it to append to the file, but each time I execute the code I get only the new entries, the prior file content is lost.

What is the proper syntax to open a file in "Append" mode?

I will deploy this code in Linux. Is there a different syntax to open a file in Linux versus Windows?

Thanks,

Oliver Wilms
