## Using the OS certificate store with TLS/SSL

There's an easy new way to add certificate authority (CA) certificates to your SSL/TLS configurations on InterSystems IRIS 2019.1 (and 2018.1.2) on Windows and Mac. You can ask IRIS to use the operating system's certificate store by entering:

`%OSCertificateStore`

in the field for "File containing Trusted Certificate Authority X.509 certificate(s)". Here's an image of how to do this in the portal:

The screenshot shows a configuration interface with the following elements:

- Type:** Radio buttons for  Client and  Server.
- Server certificate verification:** Radio buttons for  None and  Require.
- File containing trusted Certificate Authority certificate(s):** A text input field containing the value `%OSCertificateStore`, with a **Browse...** button to its right.

And here's a [link to the documentation](#) which describes this. It's in the list of options under "File containing trusted Certificate Authority certificate(s)".

That's all you need to do! Now this configuration will accept certificates issued by any CA listed in the OS certificate store.
