How to execute a program from a program and capture the results from the executed program

Hi,

I have a program that displays the current running processes to the screen. I need to have a program execute that display program and capture the results to a file. The display program does pause at the bottom of each page waiting for an 'enter' to go to the next page.

Note(the display program will not successfully compile on the current system but it does work)

Also - very, very new to Mumps.

Thanks,

Bob
