Working with \$ZF function

Good morning,

I'm trying to understand \$ZF function, but only documentation isn't enough in this way. So my question is is there any possibility to get environment variable by this function into ensemble?

I've tried this as example from documentation, but there is an error and I don't know why...

```
SET a = $ZF(-100, /SHELL, "pwd")
^
<SYNTAX>
%SYS>set a = $ZF(-100, "/SHELL", "pwd")

SET a = $ZF(-100, "/SHELL", "pwd")
^
<FUNCTION>
%SYS>■
```

Thanks for your solutions.

Zdenek
