How to verify, that manifest was installed?

Hello community,

I need to know if there is any method which can me say specified imported files or namespaces in Cache.

To better specification of my problem, I've got two installer manifests. Firts one did some resource changing and import some files and classes, second one must be started after the first one, because it's only his update, which creates some nemaspaces. So i need to check if the first manifest ran succesful and I can start the second one.

Is it good way trying to do this by some method or are there some other, better ways maybe by ccontrol, I don't know?

Thanks so much for your help and time
