Business Process

Hi,

I had written one .net service for excel validation , after validation the data will be inserted in DB. I am getting value from an outbound message but the values are not inserting in DB. i have two classes one is for reading the value from excel and convert that into ensemble objects, here i am getting value. Another class for inserting the values from the ensemble objects but here i given a global variable for checking . It's shows global variable does not exist. I don't why it's not entering to 2nd class. Please give me the step by step explanation

[#Ensemble](#)
