How to get number of segments in a hl7 message and then pull a field value from the last segment

Hi, Is there a way to count the number of segments in a HL7 Message? I tried the examples from the other answers but nothing works for me.

I am writing a function to get the last OBX segment field value 5. Below is a sample screenshot of what I want.

1	MSH		^~\&	
2	PID		1	.
3	PV1		1	
4	ORC		SC	
5	OBR		1	.
6	OBX		1	NM
7	OBX		2	132

5th Segment

The number of obx segments can change, so I want to count the last obx segment and then get the field 5 value.

Would appreciate some guidance on this.
