Name of variable after being passed

Hi,

I believe the healthshare Debug module did this (if you added it) but I no longer have access to Healthshare to look so am asking here.

Suppose I have;

```
Set fruit="apple"
```

```
set person="john"
```

```
d ..Something(fruit, person)
```

```
quit
```

```
ClassMethod Something(objs...) {
```

```
    ; Names of variables passed in
```

```
}
```

In side "Something" how can I see the original name of the variable passed in (i.e. know the variables passed in were called fruit and person and not just their values).

I appreciate this is rare and not idea but I am 90% sure the Healthshare debug service allowed this so there must be some obscure "call" somewhere to know (or I'm wrong). Anyone know the trick?
