Using ctrl-c during checking the list of databases

Hi ,

I am new to cache and I want to check with the experts to see if using the ctrl-c option while checking the list of databases is valid one or will it cause any issues. Below is my scenario

I use the below command to check the list of database

```
%SYS>do ^MSU
```

- 1) Create a database
- 2) Edit a database
- 3) List databases
- 4) Delete a database
- 5) Mount a database
- 6) Dismount a database
- 7) Compact globals in a database
- 8) Show free space for a database
- 9) Show details for a database
- 10) Recreate a database
- 11) Manage database encryption
- 12) Return unused space for a database
- 13) Compact freespace in a database
- 14) Defragment globals in a database

Now I used option 3 to list my databases

and I got a list of databases and below is what I got

(Multiple selections allowed: * for all, or list such as 1,4,7-10)
Database directories?

but instead of using "Enter" to go back to my previous list which gave me the options like " Create databases, Edit database etc"

I accidentally picked the option 64 and it gave me

Device :

so in order to return back to the previous command list which had the below options

- 1) Create a database
- 2) Edit a database
- 3) List databases
- 4) Delete a database

- 5) Mount a database
- 6) Dismount a database
- 7) Compact globals in a database
- 8) Show free space for a database
- 9) Show details for a database
- 10) Recreate a database
- 11) Manage database encryption
- 12) Return unused space for a database
- 13) Compact freespace in a database
- 14) Defragment globals in a database

I entered "CTRL-C" and it brought me to the list of options which I needed. Can you please let me know will using "CTRL-C" instead of "Enter or return" will it cause any issues

Thank you

Karthik
