Common Testing Frameworks.

Hi,

I'm after feedback and comments on the sort of tools and approaches the wider InterSystems community uses for QA Testing applications written in Cache/Ensemble or IRIS. I am aware of the %UnitTest package, and understand how that works... but:

- Do you use an alternative or framework built around this native Unit Testing tool ?
- What is your experience with %UnitTest if you use it ?
- Is there a tool you would recommend for your UI (I know this is not specifically an InterSystems' related question)
- What process do you use to routinely run tests on your application ?

Any other comment/feedback on this area would be welcome and I'm sure prove interesting for other members seeking to explore automatic, QA testing of applications

Thanks

Steve
