Looking for a way to add a new column in Trak

Hi All,

I'm currently trying to modify the provider portal using Trak to add a new column. Using the column editor to get the column to display on the page is relatively simple, but where I'm running into problems is modifying what will display in the column.

Essentially, it just needs to run a simple "if value in column A is in this list, display x, else display y" which is easy enough to write in ObjectScript, but the ISC documentation is relatively sparse about how to get a specific column to run that bit of code to display what I need it to.

Appreciate any insights you all can provide.
