SQLCompute does not work when Insert/Update done via the Caché ODBC DLL

I have SQLCompute with SQLComputeCode on a couple of Properties in my class.

These work fine when I insert/update via ObjectScript or SQL from the ManagementPortal.

However, if I insert (create new record) via my C# app using the Caché ODBC DLL the SQLCompute is ignored, it does not run.

Is this expected InterSystems Caché behaviour? We are on latest IRIS platform.
