Intelligent Global Compare wanted

I'm looking for some existing solutions to compare 2 global structures.

- by subscripts
- if subscripts match then by content.

It is not just for $^X \neq ^Y$ over identic subscripts
but also for partial subtree structures like $^X(123, "ABC") \neq ^Y("v1", 1, "backup")$ and then whole tree below.
I just want to check before re-inventing the wheel again.
