REST service with 11G Sql

Hi, I asked last week and they gave me some little tips. But the truth is I still can't carry out this "Project".

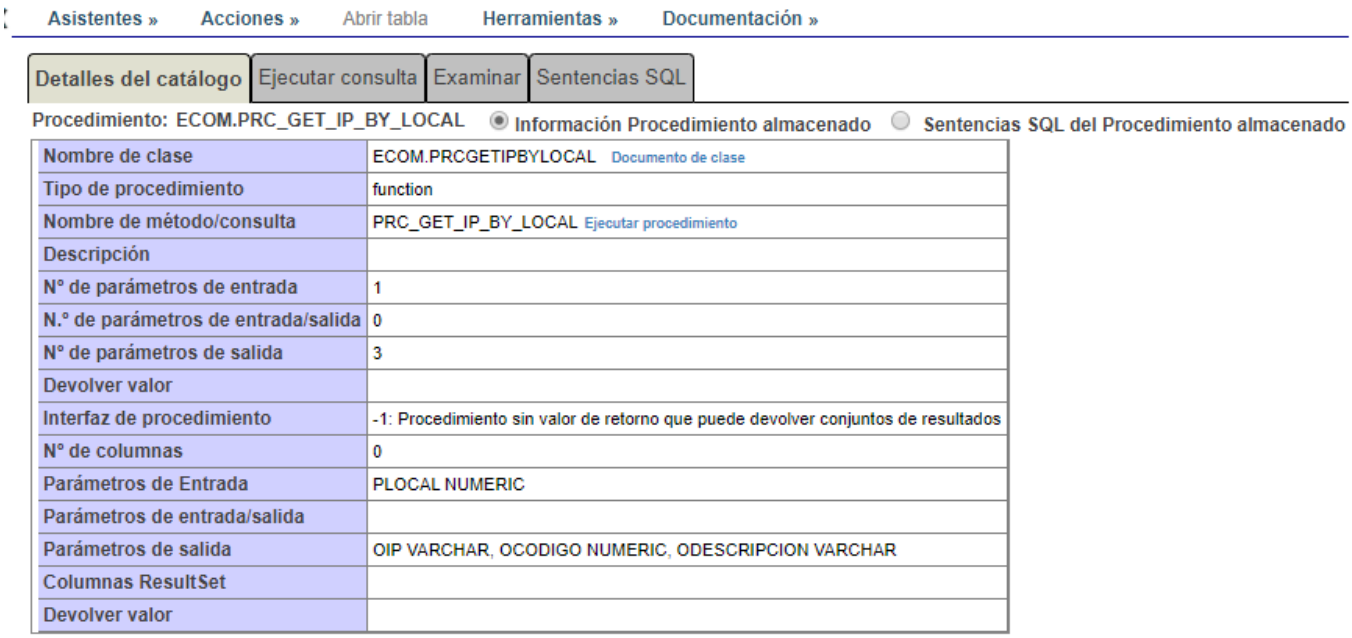

I must perform a REST service, using Oracle 11 database. Eh tried anyway to achieve this.

The purpose is to make a REST service, using the database provided to me and use the procedure that is already created.

According to what I read, I made the connection via JDBC and I had no major problem

Then I managed to read the bd inside iris and capture its procedure, but at the time of doing this. The procedure does not work correctly.

The truth is that I am very complicated with this for about 1 month using iris and creating services, but never with an external bd and less oracle. If someone can give me help I would appreciate it too much.
