recent version of zenutils.js

Hello community,

I recently added a change to our copy of zenutils.js, and while moving it up to production, I found different versions of zenutils.js. I edited a copy stored in the default directory for our web application (e.g. `c:\InterSystems\DEV\CSP\{application}`) but the file on production is stored in `{install dir}\CSP\broker`.

Where should this file live, and if it lives in the default dir for our web application, is that location used before `CSP/broker`? We have way too many copies of this file, and the copy that I edited was out of sync with the version on production. I'd like to put it in just the one place, so that it's updated as needed.

In case you're wondering, I added this:

```
function zenParseDate(value,hasTime,format,sep)
{
  // "/null
  if (null == value || " == value) return "";

  // 10/30/2019 RHS/LLC T1471
  if (value == 'Invalid Date' || value == -1) return -1;

  ...
}
```

In the date control, a value of 'abcdefg' could return valid date value of 01/01/2019 even while displaying 'Invalid Date'. -- of course, I wasn't working on the latest version of the file, so it might have been fixed already. Hence, the question about where it should live.

Thanks,

Laura
