Record map (with batch header) to CSV file

Hello,

I am reading in an X12 document into my production that needs to be processed and returned as a CSV file. I have created a record map to support the fields I want to extract with a batch class to store headers. I have a DTL mapping the data to the appropriate fields in the record map and am sending the record map to a EnsLib.RecordMap.Operation.BatchFileOperation.

None of my components error out and in fact report that the message was processed without any errors but I am not getting an output file in my expected output folder.

Is this an appropriate use of this operation class? What am I doing wrong?

I have tried setting an intermediate file path, without one, setting a txt or csv output file name, changing input and output directories.

My record name is INFORMATION.FPL.Record and batch class: INFORMATION.FPL.Header

Any help is appreciated. Thank you in advance.
