ObjectScript Package Auto Publishing is Now Available on Open Exchange!

Hi Developers!

I'm pleased to announce that ObjectScript package publishing is now generally available on Open Exchange with this November 2019 release!

If you want your ObjectScript application to be published in ObjectScript Package Manager just enable "Publish in Package Manager" option:

Application Editor

Github URL	Application name *
<input type="text" value="https://github.com/intersystems-community/objectscript-docker-template"/>	<input type="text" value="objectscript-docker-template"/>
Download URL *	License URL *
<input type="text" value="https://github.com/intersystems-community/objectscript-docker-template"/>	<input type="text" value="https://github.com/intersystems-community/objectscript-docker-template/blob/maste"/>
Category *	InterSystems Technology *
<input type="text" value="Technology Example"/> Click it to make Open Exchange publish/update the package	<input type="text" value="InterSystems IRIS"/>
Industries	<input type="checkbox"/> Submit the app on behalf of InterSystems-Corporation
<input type="text"/>	<input checked="" type="checkbox"/> Publish in Package Manager

And send the app on approving.

Once the application is approved it will be published automatically in [ObjectScript Package Manager Registry](#) and will be available for installation via ZPM client.

See the details below.

What are the requirements?

The application should be open source published in the Github repository.

The repository should contain module.xml file in the root which describes the module.

ObjectScript Package Auto Publishing is Now Available on Open Exchange!

Published on InterSystems Developer Community (<https://community.intersystems.com>)

[Pick the right name for your package and classes](#)

ObjectScript source code folder should be placed in a special order - [read more here](#).

[Read how to create a module.xml and test it before publishing.](#)

Here is [the template of the ObjectScript app](#) with [module.xml](#) which is ready for automatic publishing.

Copy it and submit your applications to ZPM which will make its installation as easy as:

```
zpm: USER>install module-name
```

in terminal or

```
zpm "install module-name"
```

dockerfile.

Stay tuned!
