[Ensemble] Req table with big data

Hello,

I've got a table with many attributes and data. There is 10 000 000 registrations approximatly.

I need to make a research on this table with filters, paging, and order.

You can see an example of my SQL request :

```
SELECT * FROM ( SELECT TOP ALL * FROM ANCVData.Titre WHERE etatTitre = 'Emis' ORDER BY  
numRemise desc) v WHERE %vid BETWEEN 1 AND 25
```

Cause there are many data on my table, my SQL req is too long if I don't have index on my attributes BUT there are many associations possible...

Are they any solutions ?

Regards,

[#SQL](#) [#Ensemble](#)
