##class(%ZEN.Auxiliary.jsonProvider).%WriteJSONStreamFromObject(), Remove class property

I am converting an object to json, but in the result a "class" property appears, is there any way to remove this?

```
ClassMethod ConvertJSON() As %Status
 {
     Set tSC = $$$OK
     Try{

         Set Store   = ##class(%ZEN.proxyObject).%New(),
             Clients = ##class(%ListOfObjects).%New(),
             Client  = ##class(%ZEN.proxyObject).%New()

         Set Car = ##class(SKYankee.Planejamento.Operacao.Car).%New()
         Set Car.name = "f150"
         Set Car.color = "blue"

         Set Client.code = 1,
             Client.name = "Leonardo",
             Client.car = Car
         Do Clients.Insert(Client)

         Set Store.name = "Intersystems Store",
             Store.address = "80 Delancey St, New York, NY",
             Store.clients = Clients

        $$$THROWONERROR(tSC, ##class(%ZEN.Auxiliary.jsonProvider).%WriteJSONStreamFromObject(.JsonStore,Store))
        Write JsonStore.Read()

     } Catch tException {
         Set:$$$ISOK(tSC) tSC = tException.AsStatus()
     }
     Quit tSC
 }
```

SKYankee.Planejamento.Operacao.Car is a %SerialObject

Result:

```
{
    "address":"80 Delancey St, New York, NY",
    "clients":[ {
            "car": {
                "_class":"SKYankee.Planejamento.Operacao.Car",
                "name":"f150",
                "color":"blue"
            },
            "code":1,
            "name":"Leonardo"
        }
    ],
    "name":"Intersystems Store"
}1
```
