Web Technologies To Choose - Opinion Wanted

Hi,

I am planning to build a WebApp that will have tons of data to display in tables, ability to add comments on that table rows and may be some few more small features as we move on.

1. It has to be Secure
2. It has to be fast
3. It has to be Non CSP / Non Zen
4. Will have Cache DB to pull records from but should be flexible to do that from any odbc resource
5. Version 2018 Ensemble

My first step would have been to investigate different options for technologies that would make it work and best suited with Ensemble 2018

Before I move forward I wanted to ask our community what do they think the route should be, the technologies I should go for and their experiences of the same.

Appreciating in advance the response and opinions. There will be no right or wrong answers to it

Many Thanks
