Using %ConstructClone with many-to-one relationships

This is a lesson learned, which I would like to share with community.

Recently I ran into an issue, where I was using %ConstructClone and it kept cloning extra records, which were not needed. The record for which I was trying to run a clone had many-to-one relationships.

The solution to this issue was using param -1. If you run %ConstructClone(-1) it will not clone relationships, but rather just clone single oref as desired in this case.

I hope this information helps someone who is working with similar records.
