Best BI Tool Compatible with IRIS

Hi All, We have been using DeepSee which has been the integrated Analytic Dashboard built over Cache Cubes. It works fine but it's visual capabilities are limited and most probably is getting phased out. If I am not wrong, Tableau is the suggested alternative to DeepSee . It is expensive and a big and considerable shift from existing technology I wanted to get an opinion of the community as to these few key points - What other BI tools others have been using with IRIS and what have been their experience - For which tools are the best inbuilt support / api's avaialble in IRIS - How easy would it be to configure in an existing ZEN application as we definitely don't want users to go to another app just for BI. (Yes ZEN is phased out but we have a lot built on it already, thus will take a while to make that change, thus this is a discussion for some other day) - Top of my head these are few names which come to mind. MS Power BI, SAS & Apache Spark. I don't have good knowledge of either, thus before spending my time on learning, a guide to which direction should we put our efforts in would be much appreciated. Thanks in advance.
