%iFind.Highlight

Hi

I've been working with SQL using an iFind index to search text. Using the %iFind.Highlight function in my SELECT statement I can get text back that highlights the found words using and

I am aware that using `##class(%iFind.Utils).Highlight`, I can pass a parameter to override the tag and use instead a tag with style to change the background color of the found words.

Is there a way to override the tag from a SQL statement?

Thanks
